## ARTHROSCOPIC ANTERIOR STABILIZATION REHABILITATION PROTOCOL

	RANGE OF MOTION	IMMOBILIZER	EXERCISES
PHASE I 0-6 weeks	<ul> <li>0-3 weeks: None</li> <li>3-6 weeks: begin</li> <li>PROM</li> <li>Limit flexion to 90°,</li> <li>external rotation to 45°,</li> <li>extension to 20°</li> </ul>	<ul> <li>0-2 weeks:</li> <li>Immobilized at all times day and night</li> <li>Off for hygiene and gentle exercise only</li> <li>2-6 weeks: Worn daytime only</li> </ul>	<ul> <li>0-3 weeks: elbow/wrist ROM, grip strengthening at home only</li> <li>2-6 weeks: begin PROM activities – Codman's, posterior capsule mobilizations; avoid stretch of anterior capsule and extension; closed chain scapula</li> </ul>
PHASE II 6-12 weeks	Begin active/active assistive ROM, PROM to tolerance	None	Continue Phase I work; begin active- assisted exercises, deltoid/rotator cuff isometrics at 8 weeks
	<b>Goals:</b> Full extension rotation, 135° flexion, 120° abduction		Begin resistive exercises for scapular stabilizers, biceps, triceps and rotator cuff*
PHASE III 12-16 weeks	Gradual return to full AROM	None	Advance activities in Phase II; emphasize external rotation and latissimus eccentrics, glenohumeral stabilization
			Begin muscle endurance activities (upper body ergometer)
			Cycling/running okay at 12 weeks
PHASE IV 4-5 months**	Full and pain-free	None	Aggressive scapular stabilization and eccentric strengthening
			Begin plyometric and throwing/racquet program, continue with endurance activities
			Maintain ROM and flexibility
PHASE V 5-7 months	Full and pain-free	None	Progress Phase IV activities, return to full activity as tolerated

\*Utilize exercise arcs that protect the anterior capsule from stress during resistive exercises, and keep all strengthening exercises below the horizontal plane in phase II

\*\*Limited return to sports activities
